

The image shows a wall composed of large, rectangular ceramic panels in a warm, terracotta or orange-brown hue. The panels are arranged in a staggered, two-level pattern, creating a sense of depth and architectural rhythm. The lighting is soft and even, highlighting the subtle texture of the ceramic. A dark, thin metal or ceramic trim is visible at the joints between the panels, emphasizing their geometric layout. On the far left, a vertical grey bar is partially visible, likely a design element from the page's layout.

PRODUCT DESCRIPTION

FRONTEK PANELS FOR VENTILATED FAÇADES

ADVANTAGES OF VENTILATED FAÇADES

Ventilated façades main difference with other façade solutions consists on the inclusion of an external layer, separated from the main wall by an air chamber. This allows to improve the waterproofing, acoustic, thermal and aesthetic properties.

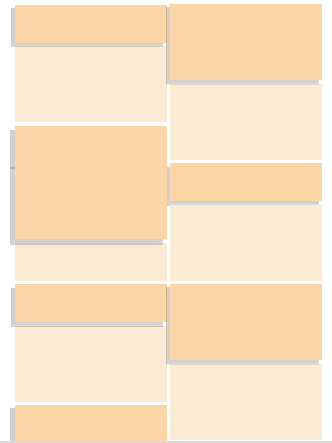

The main components in a ventilated façade are:

- Covering: the skin of the building, composed by ceramic plates.
- Anchoring structure: elements that support and fix the covering against forces.
- Air chamber: between the covering and the insulation.
- Insulation and waterproofing: applied on the outer face of the supporting wall.
- Supporting wall: it transmits the forces to the main building structure.

ADVANTAGES OF FRONTEK

Frontek extruded ceramic panels are the best solution for ventilated façade covering, as long as it has several functional and construction advantages:

- Easy and quick to install
- Great strength and durability
- Lightness of the system
- Replacing individual tiles
- Excellent stability of the ceramic covering, without risk of cracking or detachment.
- Removing condensation on the inner wall face
- Weather protection
- Low maintenance
- Easy to clean
- Aesthetic beauty

TWO LAYERS SYSTEM

EXPERIENCE A WORLD OF VOLUME AND TEXTURE

TWO LAYERS' SYSTEM WITH FRONTEK PIECES:

This systems aims to show the versatility of Frontek ceramic panels in an innovative solution.

With inner and outer pieces in two different layers, this solution adds a volumetric and sculptural effect to the façade.

Combining the wide range of Frontek panel colours and textures as well as the use of different sizes in modules, a world of possibilities emerges to add aesthetic and architectural value to your design.

SYSTEM DESCRIPTION:

Frontek pieces are supported by specially designed horizontal aluminum profiles, which can solve the difference between the two layers with only one bar.

The use of this horizontal guides allows mounting and replacing the panels easily, as the pieces in different layers can move independently.

This profiles are fixed by screws to the supporting structure, consisting of vertical aluminum square profiles. This profiles are fixed to the bearing wall by supporting steel brackets previously screwed. Retaining brackets help to prevent horizontal movement of the vertical profiles against wind forces.

We are aware of the finishes' importance for the whole system performance. Aluminum profiles for covering panels' sides fit into the horizontal profile shape with tabs for this purpose.

Finally, a series of accesories are provided for common solutions in top and bottom cladding, corners and windows.

Inside-Outside System

HORIZONTAL SECTION. SAME LEVEL PIECES

Bearing wall

Waterproofing

Insulation

Expansion anchor

Retaining bracket ECI 60.
Extruded aluminum

Ensemble stainless screw DIN 933 M8x60

Tube shaped vertical profile 40x40x3 mm.
Extruded aluminum

Horizontal profile for different level pieces.
Extruded aluminum

Frontek ceramic piece

Bit end screw. DIN 7504 Stainless steel hexagon head 5.5x1.9

EPDM Plastic gasket for joints
